

# Cabin Air Filter DIY

There are two air filters for the cabin. One is easily accessible from the trunk the other is behind the glovebox towards the center of the vehicle. It is accessible from beneath and behind the glove box.

- First, get cold beer- I missed this step and regret it and get flashlight.
- Second remove a thin rubbery covering behind and in back of glovebox. Turn on flashlight. I initially forgot to do this
- Third remove two plastic screws and pull down rubbery covering it is attached towards center of no need to remove it
- Fourth pull down plastic door towards center of car it is hinged
- Fifth squeeze and pull down filter and note which way arrow on filter end is pointing indicates air flow. The carpet is in the way, just muscle it back and pull filter down
- Sixth marvel how dirty filter is
- Seventh squeeze filter back while you shove it back up and close hinged door
- Eighth put rubbery covering and screws back. You can tighten the screws by hand.
- Ninth drink beer.
